

Burkina Faso could drastically increase the use of renewable energy in its power mix by developing battery storage solutions through public private partnerships, according to a roadmap supported by IFC.

This study presents a techno-economic feasibility analysis of solar PV system integration with conceptualized Pumped Hydro Storage (PHS) and electric batteries for Burkina Faso. The study explores two cases (a) an off-grid PV with a storage system for rural areas and (b) a grid-connected PV system for an urban location.

Additionally, a 5 MW/20 MWh battery storage system will be installed to ensure efficient electricity storage and distribution. Burkina Faso's Ministry of Energy, Mines, and Quarries aims to improve energy reliability at Donsin airport while increasing the country's overall power generation capacity.

It outlines how Burkina Faso could reduce its reliance on fossil fuels and energy imports by taking advantage of its fast-growing solar power sector. The report found that by deploying 60-70MW (160-220MWh) of independent battery energy storage solutions (i-BESS) the energy sector could potentially save between 800 million and 1.8 billion FCFA ...

According to the Burkina Faso government's roadmap, by deploying 60-70 MW (160-220 MWh) of independent battery electricity storage solutions (i-BESS), the energy sector could potentially save between 800 million and 1.8 billion CFA francs (EUR1.2 million to EUR2.7 million) per year, while reducing CO2 emissions.

The present study aims to assess, through the life cycle assessment tool, the environmental impacts of a PV system with energy storage installed in Burkina Faso. This study also aims to evaluate the influence of the type of battery and the type of end-of-life management on the overall impact of the PV system.

Lithium iron phosphate (LFP) batteries from manufacturers CATL and Narada are among those ranked highest performance for stationary energy storage applications in DNV's new "Battery Scorecard". The performance assessment group published the fourth edition of the annual scorecard report last week.

IFC helps Burkina Faso speed up renewables and storage deployment. The bank states that the African state could save between \$1.5 million and \$3.3 million per annum by installing 60-70MW (160-220MWh) of independent battery energy storage solutions.

This study investigated three scenarios based on the existing microgrid's characteristics: conventional

Burkina Faso batteries storage

standalone diesel generators, PV/diesel without battery storage and PV/diesel with a battery storage system which are the main technologies used for off-grid rural electrification in Burkina Faso.
