Could Your Electronics be powered by a cheap sea salt battery?

Your electronics could soon be powered by an ultra cheap sea salt battery. Researchers have built a new cheap battery with four times the energy storage capacity of lithium. Constructed from sodium-sulphur - a type of molten salt that can be processed from sea water - the battery is low-cost and more environmentally friendly than existing options.

Could Your Electronics be powered by a 'molten salt' battery?

Lithium - the main component in most electric batteries - can be costly to mine. But researchers have made a breakthrough with alternative 'molten salt' batteries. Your electronics could soon be powered by an ultra cheap sea salt battery. Researchers have built a new cheap battery with four times the energy storage capacity of lithium.

What is a saltwater battery?

This battery uses saltwater produced from seawater as its electrolyte solution, which is how it gets its name. This allows for sodium to be the main conductor, being a much safer option than the lithium-ion or lithium iron phosphate option. Unlike traditional batteries, saltwater battery technology does not require preventive maintenance.

What is a molten salt battery?

Molten-salt batteries are a class of battery that uses molten salts as an electrolyte and offers both a high energy density and a high power density. Traditional non-rechargeable thermal batteries can be stored in their solid state at room temperature for long periods of time before being activated by heating.

What is a Sumitomo battery?

Sumitomo studied a battery using a salt that is molten at 61 °C (142 °F), far lower than sodium based batteries, and operational at 90 °C (194 °F). It offers energy densities as high as 290 Wh/L and 224 Wh/kg and charge/discharge rates of 1C with a lifetime of 100-1000 charge cycles.

What is a sodium sulfur battery?

The sodium-sulfur battery (NaS battery), along with the related lithium-sulfur battery employs cheap and abundant electrode materials. It was the first alkali-metal commercial battery. It used liquid sulfur for the positive electrode and a ceramic tube of beta-alumina solid electrolyte (BASE).
