

This Energy Transition Norway (ET Norway) report describes the energy future of Norway through to 2050. The analysis, the most likely model framework behind it, the methodology, the assumptions, and hence also the results lean heavily on DNV's global forecast, the Energy Transition Outlook 2023 (DNV, 2023a) and the Energy Transition

"We are transitioning out of oil, out of gas, out of fossil, and now into a new chapter. I emphasize transitioning, because this is complex; when energy sources shift, power shifts and politics shifts", said Prime Minister Jonas Gahr Støre.

Afore's presence at the SNEC from June 13-15 was a highlight! Our cutting-edge PV Inverters, hybrid inverters and All-in-One Energy Storage Systems showcased the future of energy solutions. We are thrilled by the overwhelming response to Afore's innovative solutions at ...

Discover why Norway, despite its wealth in renewable resources, lags in domestic energy transition and how it can seize leadership in sustainable energy.

The new energy reality combined with the need also for a Norwegian energy transition would require Norway looking into all potential renewable energy generating activities, including both offshore- and onshore wind, as well as solar power.

Afore not only dominates the Chinese market, but also establishes extensive sales, warehousing and after-sales service centers around the world, sowing the seeds of green energy to every corner of Europe, the United Kingdom, Australia, China, India, Japan, North America, South America, etc. Afore's products are like a reliable messenger that crosses thousands of ...

Offshore acreage will once again be the promising province for Norway's energy production expansion. On an Oslo key side Tuesday 9 February, Prime Minister Støre of the Labour lead minority Government announced the prioritised first steps for awarding acreage for wind power projects in the North Sea.

As Norway moves into the next chapter of its energy history, renewable energy is becoming an increasingly important part of the landscape. Offshore wind, hydrogen, and solar energy are key areas of growth for the country, with major investments being made to expand capacity and develop new technologies.

Norway's electricity needs will double to 260 TWh by 2050, accounting for 65% of the country's total energy demand, according to DNV's analysis. Fossil fuel consumption will decrease by more than half during the same period, with oil consumption in transportation expected to drop by as much as 80%.

Norway afore new energy
