

What is the standard for pulse solar container capacitors

What is a pulse capacitor?

The capacitors for pulse applications feature solder lugs or snap-in terminals for connection. These capacitors ensure constant pulse factors, even under conditions of large number of continuous discharges with short pulse repetition intervals. They feature low leakage currents and thus help the application be as energy efficient as possible.

Are Eaton film Pulse capacitors reliable?

Eaton's film pulse capacitors, including the EFPLS and EFPLA, offer high dV/dt handling and current capacity, self-healing capability, and ensure reliable performance in high-frequency power supplies and motor drives, with products meeting automotive reliability standards.

What is a film Pulse capacitor?

High current capacity - Eaton's film pulse capacitors can handle substantial currents, making them ideal for fluctuating conditions. Self-healing property - Like Eaton's DC link capacitors, these film pulse capacitors possess the self-healing property due to their metallized structure.

What parameters define the pulse handling capability of a capacitor?

The parameters that define the pulse handling capability of a capacitor are the maximum dV/dt and k_0 it can withstand. Values of maximum dV/dt are given in the data sheets of the individual types. Units are $V/\mu s$, where μ is the pulse width and R_i the resistance of the contacts (internal resistance). To relate the

How high can a capacitor be used?

Capacitors can be used at pressures down to 40 kPa without voltage derating being necessary. This corresponds to an altitude of 7000 m (approx. 23000 ft) above mean sea level. Capacitors for use at altitudes above 7000 m can be developed on special request. Heat transfer can be affected by high altitude operation.

What criterion should be used to manufacture self-healing capacitors?

An important construction criterion in the manufacture of reliable, self-healing capacitors for pulse applications is the current-carrying capacity of the contacts, i.e. the connection between the terminating wires and the electrodes.
